We aim to solve three key challenges. Henrik is based on 100s of hours of workshops and interviews with a permitting agent from a Danish municipality. To meet the European Union's climate and energy security goals, the EU needs to build an average of 31 GW of onshore wind farms per year until 2030. This is tentatively called EasyPermits.

**Digital Permitting Solution**

To drive breakthroughs to accelerate the energy transition, we are simplifying Information Management. We are simplifying Process Transparency. We are proactively making our voices more familiar and effective, as well as our brand and communications to our marketplace in the different parts of the permitting process, and making it easier to navigate, which helps make long-term of engagement alive and builds and customer and policy maker. Collaborations for a permit application can also interact with each other in real-time. The documents in real-time while being stored in one single repository.

![Digital Permitting Solution](https://example.com/digital-permitting-solution.png)

1. **Information Management**
   - We are simplifying Information Management.
   - Permitting agents are faced with multiple permits applications. But how many are the actual processes in different channels, via different channels, from different industries? Often hard to know.
   - Projects and the impact they might have on the local community is often hard to know. It's hard to answer and be accountable.
   - The current status is not easy to locate.
   - We have taken the lens of a permitting agent working at the municipal permit granting authority to solve for his pain points when processing permit applications for onshore wind farms.

2. **Process Transparency**
   - The community members can apply to see the relevant details of the planning applications. When facing the general public, they are facing the critical path.
   - Social stakeholders help in processing the pace of the clean energy transition. This is why we have to do this for the permit agents.

We have set out to be a part of setting the key challenges for the permitting agents and other involved stakeholders.
